

LEIF

MVP Product Requirements Document

Parent & Child Academic Support EdTech Platform

PHASE 1 Global Product Vision

STATUS

MVP / Capstone
Product Definition

PRODUCT MANAGER

Hajime Cohort

VERSION

V1 — Research-aligned MVP

TRACK → UNDERSTAND → SUPPORT → IMPROVE

Purpose: Source of truth for research, design, development, testing, and product decisions.

1. Product Summary

LEIF is a global parent and child academic-support platform designed to help parents better understand their child's academic progress, identify areas that need attention, and know what practical steps they can take to provide support.

Core MVP

- Parent profile
- Child profile
- Academic dashboard
- Academic Journey / progress history
- Areas of strength and concern
- “How Can I Help?” guidance
- Progress monitoring
- Basic privacy/access controls
- A lightweight learner academic workflow

The MVP will not attempt to replace schools, teachers, tutors, or full learning-management systems.

2. Research Foundation

User research was conducted to understand how parents and caregivers monitor children's academic performance, the difficulties they experience, and the support they would find useful.

Research finding	Evidence	Product implication
Parents are already involved	Parents use teachers, homework, conversations, report cards and meetings.	Make existing information easier to understand and act on.
Parents want progress over time	35 of 39 valid responses (~90%) rated multi-year history very/extremely useful.	Academic Journey and progress tracking are core.
Parents want practical guidance	“Suggestions on how I can help at home” was most selected (14 responses).	“How Can I Help?” is core.
Parents need clearer support signals	Recurring challenges included identifying struggle areas and knowing what to do.	Dashboard + areas of concern should lead to action.
Privacy matters	20 selected control over shared information; 12 selected strong privacy/data protection.	Basic privacy/access controls belong in MVP.

Research sample: 43 responses: 32 parents (74%), 6 guardians (14%), and 5 other caregivers (12%). The sample was concentrated around younger children, particularly ages 3–5 and 6–9; findings are therefore exploratory rather than representative of every K–12 age group.

Research limitation: Some multi-select questions were answered as single-choice questions. Findings should be interpreted as selected responses, not a complete record of every behaviour or need.

3. Problem Statement

Parents can be actively involved in their children's education and still struggle to clearly identify where their child is having difficulty, understand academic performance beyond a final result, track progress over time, identify areas that need attention, and know what practical action to take at home.

Core problem: Parents may have academic information about their children but lack a simple way to understand the bigger picture, identify where support is needed, and know what practical action to take.

4. Product Opportunity & Hypotheses

LEIF sits between a child's day-to-day academic activity and a parent's need for visibility and action. The MVP connects academic information, progress visibility, areas needing attention, practical support, and improvement tracking.

Hypothesis	Evidence status
Parents need a clearer, more continuous view of academic progress.	Supported by research
Parents need actionable guidance rather than performance information alone.	Supported by research
Parents value seeing progress and changes over time.	Strongly supported by research
Parents need simple ways to identify areas requiring attention.	Supported by recurring pain points
A lightweight, mobile-friendly experience matters across diverse user contexts.	Product hypothesis; validate further
Parents value control over child academic information.	Supported by research
A structured learner workflow complements the parent experience.	Proposed; requires further validation

5. Target Users

User	Status	Primary need
Parent / guardian	Primary validated user	Understand progress, identify support needs, take practical action, monitor improvement.
K–12 learner	Secondary / proposed user	View academic activity, understand progress, complete defined activities, see next step.
Teacher	Supporting stakeholder	Potential source of academic activity/progress information; no full teacher suite in MVP.

Scope note: K–12 remains the long-term product vision. The 3-week MVP should use representative grade bands rather than attempt distinct experiences for every grade.

6. Personas

Persona	Context	Needs	Pain points
Amaka	Busy working parent with limited time for consistent academic support.	Quick performance view; clear attention areas; practical actions; easy monitoring.	Limited time; uncertainty about where help is needed; difficulty explaining some topics.
Alhaji Bello	Working parent who may struggle to afford private tutoring or extra lessons.	Accessible support; clear academic needs; home activities; progress tracking.	Cost of additional support; limited time; uncertainty about what help is most useful.

These are representative personas based on the problem framing and should be refined if additional interview evidence becomes available.

7. Value Proposition & Differentiation

Value proposition: LEIF helps parents move beyond simply receiving academic results by giving them a clearer view of their child's progress, showing where attention may be needed, and providing practical ways to support their child.

Differentiation hypothesis: LEIF connects child academic activity, progress over time, areas needing attention, and parent-facing actionable guidance rather than trying to offer every EdTech feature.

- Progress visibility over time
- Action-oriented “How Can I Help?” guidance
- Parent + child workflow in one product
- Mobile-friendly, low-friction design
- Accessible, globally adaptable experience

8. MVP Goals

- Help parents understand their child's academic progress.
- Help parents identify areas where support may be needed.
- Provide practical support guidance.

- Enable progress monitoring over time.
- Give learners a simple academic workflow.
- Connect academic activity to parent visibility.
- Demonstrate basic privacy/access controls.

9. Core MVP Scope

Priority	Features
MUST	Parent Profile; Child Profile; Academic Data; Academic Dashboard; Academic Journey; Strengths & Areas of Concern; "How Can I Help?"; Progress Tracking; Basic Privacy Controls.
SHOULD	Lightweight Learner Workflow; limited Teacher Input.
COULD	Career Exploration.
LATER	Tutoring marketplace; live classes; payments; social features; full LMS; school-management features; complex integrations.

10. Academic Data Assumption

- Do not depend on real-time integration with multiple schools for the 3-week capstone.
- Prototype may use controlled/sample data for subject performance, assessment results, academic activity, progress points, and areas needing attention.
- Clearly distinguish real user-provided data from prototype/sample data.
- Future options: parent entry, teacher input, school integrations, imported records.

11. Key User Flows

Parent: Create Account → Profile → Add/Link Child → Grade → Academic Info → Dashboard → Progress → Attention Area → "How Can I Help?" → Practical Actions → Take Action → Monitor Improvement.

Learner: Sign In → Academic Journey → Current Activity → Complete/Update → Progress Reflected → Next Step.

12. Core Product Loop

TRACK	Capture or represent academic information and activity.
UNDERSTAND	Make performance and progress understandable.
SUPPORT	Identify an attention area and give practical guidance.
IMPROVE	Monitor whether progress changes after support.

Every MVP feature should strengthen this loop.

13. Functional Requirements

ID	Requirement	Acceptance criteria
FR-01	Account/Profile Creation	User can create/access a profile and relevant account information is represented.
FR-02	Child Profile	Parent can add/connect a child and represent grade/class context.
FR-03	Academic Dashboard	Dashboard communicates current academic position and key performance information clearly.
FR-04	Academic Journey	User can view progress/change across defined academic points.
FR-05	Strengths & Areas of Concern	System highlights strengths and areas needing attention using available academic data; no diagnosis.
FR-06	"How Can I Help?"	User can access practical, understandable support guidance tied to an attention area.
FR-07	Learner Activity	Learner can access and complete/update the defined lightweight academic workflow.

ID	Requirement	Acceptance criteria
FR-08	Data Relationship	Dashboard and guidance items can be traced to the academic data represented in the prototype.
FR-09	Privacy	Parent-controlled access behaviour is demonstrated; unnecessary public exposure is avoided.
FR-10	Responsive UX	Core screens are usable on a mobile-sized viewport and desktop.

14. Non-Functional Requirements

- Mobile-first and responsive.
- Simple navigation and minimal data entry.
- Low-bandwidth awareness.
- Clear, accessible language appropriate for diverse users and education contexts.
- Basic access controls.
- No unsupported academic diagnosis, intelligence claims, or future-outcome predictions.
- AI guidance, if used, must be constrained, reviewable, and non-diagnostic.

15. Global Product Considerations

- Smartphone-first experience with awareness of variable connectivity and data costs.
- Simple onboarding and low-friction workflows.
- Use education terminology that can adapt to different school systems and grading structures.
- Support flexible academic data fields rather than assuming one grading model.
- Recognize that parents may already rely on school reports, teacher communication, tutoring, messaging apps, and other existing channels.
- Do not depend on reliable real-time teacher or school integration for the MVP.

16. Success Metrics

Metric	What it tells us
Onboarding completion	Whether users can enter the product and reach the core experience.
Dashboard understanding	Whether parents understand the child's current academic position.
Attention identification	Whether users can identify an area requiring attention.
Guidance discovery	Whether users can find "How Can I Help?" guidance.
Guidance usefulness	Whether the recommended action is perceived as practical and relevant.
Core flow completion	Whether users can move Dashboard → Concern → Help → Next Action without assistance.

Original long-term targets such as 65% onboarding, 60% weekly active parents, 35% 30-day retention, and 8% improvement should be treated as future targets rather than validated capstone outcomes.

17. Validation Plan

- Interview/test representative parents and guardians.
- Where possible, speak with learners.
- Test the core flow: child profile → dashboard → progress → attention area → help → next action.
- Record whether users understand the information without assistance.
- Record research evidence separately from assumptions and prototype/sample data.

18. Out of Scope for the 3-Week MVP

- Full K–12 curriculum/content library
- Live video classes
- Teacher or tutor marketplace
- Social network/community feed
- Complex payments/subscriptions
- Full school-management system
- Advanced AI tutoring
- Automated academic diagnosis
- High-confidence career prediction
- Complex real-time school integrations
- Large-scale analytics infrastructure
- Full teacher dashboard
- Complex messaging system
- Large learning-resource marketplace

19. Prioritisation Logic

MVP success condition: A parent can understand a child's current academic position, identify an area needing attention, receive a useful next action, and later monitor progress. The learner can follow a simple academic workflow.

Priority	Focus
MUST	Parent/child profiles; academic data; dashboard; Academic Journey; strengths/concerns; "How Can I Help?"; progress tracking; basic privacy.
SHOULD	Lightweight learner workflow; limited teacher-supported data.
COULD	Simple exploratory career concept.
LATER	Marketplace; live classes; payments; social features; full LMS; school-management features; complex integrations.

Rule: If a feature does not materially improve TRACK → UNDERSTAND → SUPPORT → IMPROVE, it should normally be deferred.

20. Assumptions & Risks

Risk / assumption	Impact	Mitigation
Parents may not consistently enter/update academic information.	High	Minimise manual input; simplify updates; test workflow.
Academic data may differ across schools.	High	Flexible prototype fields; clearly define metrics.
K–12 is too broad for one MVP.	High	Keep K–12 as vision; validate representative grade bands.
Learner workflow is not sufficiently validated.	Medium	Keep it lightweight and conduct further validation.
Teacher integration may not be available.	Medium	Use controlled/sample data and document assumption.
AI guidance may be generic or inaccurate.	High	Use constrained, reviewable guidance; avoid diagnosis.
Child data may be mishandled.	High	Parent-controlled access; minimal data; no public exposure.
Long-term metrics cannot be proven in the capstone.	Medium	Report short-term usability/validation evidence.
Team scope expands because Lovable makes features easy to build.	High	PM approval for new MVP features; maintain prioritisation list.

Risk / assumption	Impact	Mitigation
Research sample is concentrated around younger children.	Medium	Avoid claiming full K–12 validation; test additional grade bands where possible.

21. Prototype / Build Guidance

Recommended sequence: Research → Problem Validation → User Definition → Requirements → Prioritisation → User Flow → Wireframe/Prototype → Lovable Build → Usability Test → Iteration

Lovable is the implementation tool, not the product strategy. The team should not add a feature simply because it is technically easy to generate.

Role	Responsibility
Product Manager	Owns scope, prioritisation, PRD, and acceptance of product requirements.
Design	Owns user experience and interface consistency.
Engineering / Lovable Builder	Owns implementation feasibility and agreed MVP build.
Research / Content	Provides evidence and supports guidance content and validation.

Every MVP feature should have an owner, deadline, and acceptance criterion.

22. 3-Week Capstone Delivery Plan

Period	Focus	Expected output
Days 1–4	Problem, users, PRD foundation	Validated assumptions/questions, user framing, PRD baseline.
Days 5–8	Research + user flows	Research findings, personas/use cases, prioritised MVP, user flows.
Days 9–14	Design + build	Core screens and working parent/child academic-support loop.
Days 15–18	Testing + iteration	Usability findings, bug fixes, improved guidance, scope cuts.
Days 19–21	Finalisation	Demo-ready MVP, validation evidence, presentation, documented learnings.

23. Definition of Done — MVP

- A representative parent can create/access a profile.
- A parent can add/connect a child.
- The child's grade/class context is represented.
- Required academic information is available for the prototype.
- The parent can view an understandable academic dashboard.
- The parent can identify at least one relevant area requiring attention.
- The parent can use “How Can I Help?” and receive a practical next action.
- The Academic Journey communicates change over time.
- Progress can be monitored across defined academic points.
- The learner can access the defined lightweight academic workflow.
- Basic privacy/access behaviour is demonstrated.
- Core screens work on a mobile-sized viewport.
- The team can explain what data powers every major dashboard item.
- The team can clearly identify prototype/sample data.
- The core flow has been tested with representative users, or testing limitations are documented.
- The team can demonstrate TRACK → UNDERSTAND → SUPPORT → IMPROVE.

24. Future Roadmap

- Broader K–12 coverage and grade-specific experiences.
- Teacher/school integrations.
- More robust academic assessment and reporting.
- Personalised learning recommendations.
- Expanded parent guidance/resource library.
- Career exploration based on interests and demonstrated strengths, with appropriate uncertainty.
- Potential monetisation and partnerships after stronger product validation.

Roadmap principle: Future features should be driven by validated user problems, technical feasibility and evidence of demand—not by the size of the feature list.

25. Final Product Statement

LEIF is a global parent and child academic-support platform designed to make a child's academic progress easier to understand and easier to act on.

The MVP focuses on one core experience: capture/represent academic activity → make progress visible → identify where attention is needed → give the parent a practical next action → allow progress to be monitored over time.

TRACK → UNDERSTAND → SUPPORT → IMPROVE

Every proposed feature should be evaluated against this loop. If a feature does not materially improve the loop, it should normally be deferred.

The four questions the MVP should help a parent answer:

- Where is my child now?
- How have they been progressing?
- Where do they need attention?
- What can I do to help?
